Title: Braidings for skew monoidal categories

Author(s): Dr John Bourke

Session: Category Theory, Algebraic Topology, K-Theory

Skew monoidal categories are a certain laxified version of monoidal category. They were introduced by Szlachanyi in 2012 in relation to bialgebroids over rings. In 2016 I described some examples of these structures arising in higher category theory. A natural question to ask is: “what is the correct notion of braiding in the skew context?” The answer is not, perhaps, what one might first guess. In this talk I will define braided skew monoidal categories and give some examples of them.

This is joint work with Steve Lack.
